\*1 Offset voltage value is after removal of core hysteresis.

\*2 Measurement condition : Primary conductor (bus bar) cross sectional area is as same as through hole, and penetration with 1 turn in through hole.

Differences occur depending on the conditions of the primary conductor (busbar).

\*3 High fundamental frequency primary current and/or harmonic current may result in excessive heating in magnetic core.

\*4 The measurement range is less than F26P100S05.

## SUPPORT DOCUMENTATION

### Reference voltage

The Ref pin has two modes Ref IN and Ref OUT.

< Ref OUT mode >

The 2.5 V internal precision reference is used by the transducer as the reference point for bipolar measurements.

< Ref IN mode >

An external reference voltage is connected to the Ref pin. this voltage is specified in the range 0 to 4 V. its voltage is used as the reference voltage at the time of measurement.

- either to source a typical current of  $(V_{ref2}-2.5)/680$ ,the maximum value will be 2.2 mA typ.when  $V_{ref2} = 4$  V.
- or to sink a typical current of  $(2.5-V_{ref2})/680$ ,the maximum value will be 3.68 mA typ.when  $V_{ref2} = 0$  V.

The following graphs show how the measuring range of each transducer version depends on external reference voltage value  $V_{ref2}$ .

$R_L=1\text{ k}\Omega$  ,  $V_{CC}=+5\text{ V}$  ,  $T_A=-40 \sim +85^\circ\text{C}$

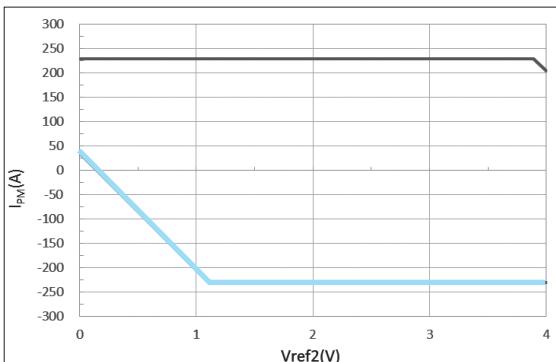

Figure 9 :  $I_{PM}$  vs  $V_{ref2}$  for F26P150S05

e. g. ; In case of F26P100S05

Upper limit :  $I_p = +270\text{ A}$  ( $V_{ref2}=0\text{ V} \sim 3.16\text{ V}$ )

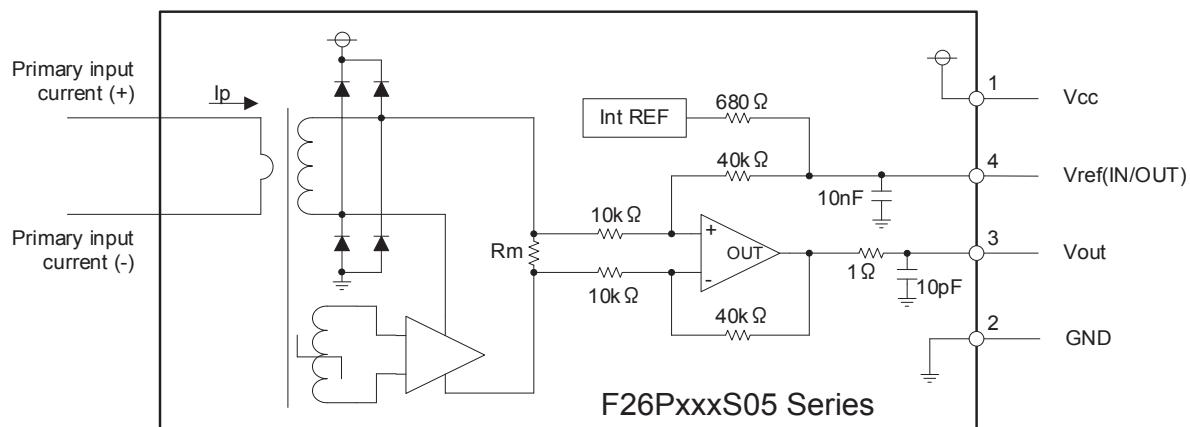

$I_p = +270-(V_{ref2}-3.16\text{ V})/0.00625$  ( $V_{ref2}=3.16\text{ V} \sim 4\text{ V}$ )

Lower limit :  $I_p = -270\text{ A}$  ( $V_{ref2}=1.84\text{ V} \sim 4\text{ V}$ )

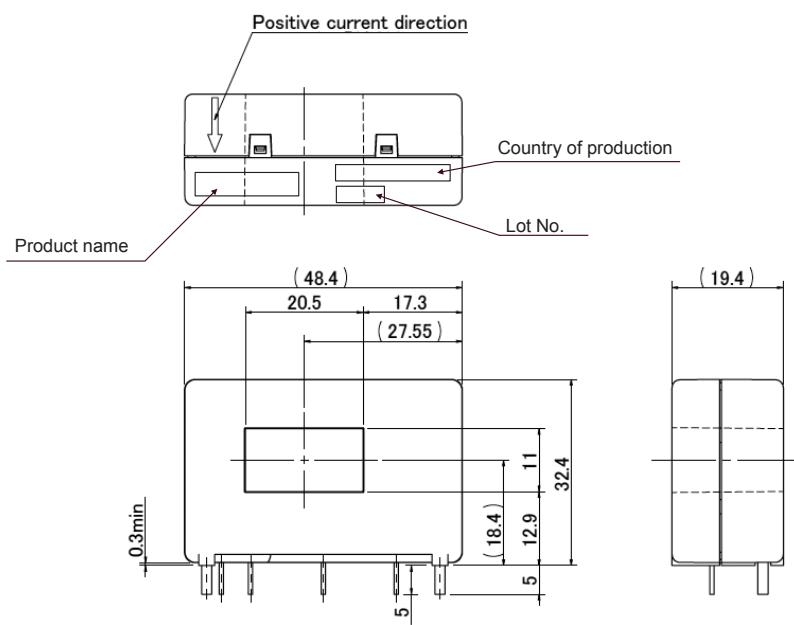

$I_p = -270-(V_{ref2}-1.84\text{ V})/0.00625$  ( $V_{ref2}=0\text{ V} \sim 1.84\text{ V}$ )

If you do not want to use the Ref pin, please unconnected.
