

36V Input, 300mA Low Supply Current, High Speed Voltage

■ GENERAL DESCRIPTION

The IXD1702 series are CMOS high-speed voltage regulator ICs with a 36 V input and low supply current. Internal circuitry includes a reference voltage supply, error amplifier, driver transistor, over-current protection circuit, overheat protection circuit, soft start circuit, and phase compensation circuit.

The output voltage is fixed internally by laser trimming, and product selections from 1.8V to 18.0V are available. The over-current protection circuit and overheat protection circuit are built-in, and when the output current reaches the current limit or the junction temperature reaches the temperature limit, the corresponding circuit activates.

The soft start circuit limits the rush current that flows from V_{IN} to V_{OUT} when the IC starts, enabling a stable startup sequence.

The IC is put in the standby state by inputting L level into the CE pin, and the supply current is reduced to 0.1 μ A. A low-ESR capacitor such as a ceramic capacitor can also be used for C_L .

■ APPLICATIONS

- In-vehicle devices
- Industrial equipment
- Domestic electrical appliances
- Portable AV devices
- Various modules

■ TYPICAL APPLICATION CIRCUIT

■ FEATURES

Input voltage range	: 4.5V to 36.0V (absolute maximum rating 42.0V)
Peak voltage	: 46.0V (Transient \leq 400ms)
Output current	: 300mA
Output voltage range	: 1.8V to 18.0V (accuracy $\pm 1\%$) $V_{OUT} < 6.0V$, 0.1V step settings $V_{OUT} \geq 6.0V$, 0.5V step settings $\pm 50\text{ppm}/^{\circ}\text{C}$ (TYP.)
Output voltage temperature characteristics	
Supply current	: 40 μ A (TYP.)
Dropout voltage	: 350mV@ $I_{OUT} = 100\text{mA}$, $V_{OUT} = 5.0\text{V}$
Ripple rejection ratio	: 65dB @1kHz
Standby current	: 0.1 μ A
Protection function	: Current limit, Short Protection Thermal shutdown
Addition function	: Soft start ON/OFF (Active High)
Output capacitor	: Ceramic capacitor (2.2 μ F)
Package	: USP-6C, SOT-89-5, SOP-8FD (Under Development)
Environment friendly features	: EU RoHS Directive compliant, lead free

^(*) Output voltage setting steps are as follows:

V_{OUT} < 6.0V 0.1V-step settings

V_{OUT} ≥ 6.0V 0.5V-step settings

For other voltages, please contact your local Torex sales office or representative.

^(*) For 10.0V to 18.0V, A to J excluding I are used in "②".

■ PIN CONFIGURATION

* For mounting strength reinforcement and heat radiation of the USP-6C and SOP-8FD(Under Development) radiator plates, it is recommended that soldering be performed according to the reference pattern layout and reference metal mask design.

To fix the voltage of the radiator plate, connect to V_{SS} (Pin 4 of USP-6C or Pin 6 of SOP-8FD(Under Development)).

V_{IN}=V_{OUT(T)} + 1.0V, V_{CE}=V_{IN}, I_{OUT}=1mA, C_{IN}=1.0µF, C_L=2.2µF unless otherwise specified.

This parameter is tested on V_{IN}=4.5V if the input voltage is under 4.5V.

⁽¹⁾ V_{OUT(E)} : Actual output voltage value.

⁽²⁾ V_{OUT(T)} : Set output voltage value.

⁽³⁾ Differences in heat dissipation when mounted may cause activation of thermal shutdown circuit, preventing attaining maximum output current.

⁽⁴⁾ V_{dif} is defined as follows: V_{dif}={V_{IN1}-V_{OUT1}}.

V_{IN1} : As input voltage is gradually reduced, the input voltage at which V_{OUT1} is output.

V_{OUT1} : 98% of output voltage when V_{IN} is input after stabilizing sufficiently at I_{OUT}=100mA.

⁽⁵⁾ Time from input of voltage higher than CE "H" level voltage into CE pin until output voltage is V_{OUT(T)} × 0.9V or higher.

⁽⁶⁾ The values under -40°C≤Ta≤105°C has been tested and guaranteed by design engineering.

■ OPERATIONAL EXPLANATION

The IXD1702 series controls the output voltage by means of a scheme in which the error amplifier compares the voltage divided by R1 and R2 connected to the V_{OUT} pin with the voltage of the internal reference power supply. The output signal from the error amplifier makes the driver transistor connected to the V_{IN} pin drive, and negative feedback is applied to stabilize the output voltage.

IXD1702 Series D Type

<Current limiting, short-circuit protection>

The IXD1702 series incorporates a foldback circuit for current limiting (460mA TYP.) and short-circuit protection(115mA TYP.).

When the output current reaches the current limit, the output voltage falls and the output current is limited.

<Overheating protection>

The IXD1702 series incorporates a thermal shutdown circuit for overheating protection.

When the junction temperature reaches the detection temperature (150°C TYP.), the driver transistor is forcibly turned off.

When the junction temperature falls to the release temperature (140°C TYP.) while the driver transistor remains in the off state, the driver transistor turns on (auto recovery) and regulation restarts. Unless the cause of rising temperature is removed, the driver transistor repeats on and off, and output waveform would be like consecutive pulses.

<CE pin>

The IXD1702 series allows stopping of the IC internal circuit by a CE pin signal.

When the IC is in the stopped state by CE "L" level voltage input, the V_{OUT} pin is pulled down by R1 and R2 to the V_{ss} level.

As long as the voltage input into the CE pin is within the CE pin voltage specification, the logic is established and there is no interference with operation.

If the CE pin is left open, operation is unspecified.

■OPERATIONAL EXPLANATION (Continued)

<Soft start>

The IXD1702 series limits the rush current (I_{RUSH}) that suddenly flows from V_{IN} to V_{OUT} to charge the output capacitor (C_L) when the IC starts, and is also able to limit fluctuations of V_{IN} due to I_{RUSH} . The soft start time(t_{ss}) is optimized internally(370μs TYP.). The soft start time(t_{ss}) is defined as the V_{OUT} reaches 90% of $V_{OUT(T)}$ from the time when CE H threshold is input to the CE pin.

Example of the inrush current wave form at IC start-up

<Low ESR capacitor support>

An internal phase compensation circuit is incorporated in the IXD1702 series to enable a stable output voltage to be obtained even when a low ESR capacitor is used. To stabilize the effect of the phase compensation circuit, always connect the output capacitor (C_L) in direct proximity to the V_{OUT} pin and V_{SS} pin. In addition, to stabilize the input power, connect the input capacitor (C_{IN}) in direct proximity to the V_{IN} pin and V_{SS} pin. Refer to Table 1 for the recommended capacitance values to be connected.

Take particular care in selecting the capacitors for C_{IN} and C_L , as the bias dependence of the capacitor, the effect of capacitance loss due to temperature characteristics and other factors, and the effects of ESR may prevent stable phase compensation. Table 1 shows recommended capacitance values (MIN) for the actual bias and temperature conditions used for the capacitor. Select capacitances that satisfy Table 1 in all environments in which the product is to be used.

Table 1: Recommended capacitance values (MIN) of C_{IN} and C_L

OUTPUT VOLTAGE RANGE $V_{OUT(T)}$	INPUT CAPACITOR C_{IN}	OUTPUT CAPACITOR C_L
1.8V~18.0V	1.0μF	2.2μF

■NOTES ON USE

- 1) For temporary, transitional voltage drop or voltage rising phenomenon, the IC is liable to malfunction should the ratings be exceeded.
- 2) Where wiring impedance is high, operations may become unstable due to noise and/or phase lag depending on output current. Please keep the resistance low between V_{IN} and V_{SS} wiring in particular.
- 3) Please wire the input capacitor (C_{IN}) and the output capacitor (C_L) as close to the IC as possible.
- 4) Capacitances of these capacitors (C_{IN} , C_L) are decreased by the influences of bias voltage and ambient temperature. Care shall be taken for capacitor selection to ensure stability of phase compensation from the point of ESR influence.
- 5) Regarding the input transient response, the undershoot at the output voltage might be larger when input voltage variation is 5.0V or larger and the through-rate is 0.5V/ μ s or higher.
If the undershoot is not acceptable, please increase the output capacitance value and evaluate the system on your PCB well.
- 6) The IC goes into “undefined state” if the CE pin is not connected (Open state).
The CE pin voltage should be fixed in low or high for stable operation.
- 7) In general, semiconductor components have a possibility to have variation of electrical specifications due to the (cosmic) radiation exposure. Therefore this product has the same possibility. Please inform us in advance if your system might have a possibility to be exposed to the (cosmic) radiation in the production process (assembly, test, etc.).
- 8) Torex places an importance on improving our products and their reliability.
We request that users incorporate fail-safe designs and post-aging prevention treatment when using Torex products in their systems.

■ TYPICAL PERFORMANCE CHARACTERISTICS

$T_a=25^\circ\text{C}$, $V_{IN}=V_{OUT}(T) + 1.0\text{V}$, $V_{CE}=V_{IN}$, $I_{OUT}=1\text{mA}$, $C_{IN}=1.0\mu\text{F}$, $C_L=2.2\mu\text{F}(\text{ceramic})$ unless otherwise specified.
This parameter is tested on $V_{IN}=4.5\text{V}$ if the input voltage is under 4.5V.

USP-6C Power Dissipation

Power dissipation data for the USP-6C is shown in this page.

The value of power dissipation varies with the mount board conditions.

Please use this data as one of reference data taken in the described condition.

1. Measurement Condition (Reference data)

Condition : Mount on a board

Ambient : Natural convection

Soldering : Lead (Pb) free

Board : Dimensions 40mmx40mm(1600mm² in one side)

Copper (Cu) traces occupy 50% of the board area

In top and back faces

Package heat - sink is tied to the copper traces

Material : Glass Epoxy (FR-4)

Thickness : 1.6mm

Through - hole : 4 x 0.8 Diameter

Evaluation Board (Unit: mm)

2. Power Dissipation vs. Ambient Temperature

Board Mount(T_{jmax}=125°C)

Ambient Temperature(°C)	Power Dissipation Pd (mW)	Thermal Resistance (°C/W)
25	1000	100.00
105	200

LIFE SUPPORT POLICY ZILOG'S PRODUCTS ARE NOT AUTHORIZED FOR USE AS CRITICAL COMPONENTS IN LIFE SUPPORT DEVICES OR SYSTEMS WITHOUT THE EXPRESS PRIOR WRITTEN APPROVAL OF THE PRESIDENT AND GENERAL COUNSEL OF ZILOG CORPORATION.

As used herein Life support devices or systems are devices which (a) are intended for surgical implant into the body, or (b) support or sustain life and whose failure to perform when properly used in accordance with instructions for use provided in the labeling can be reasonably expected to result in a significant injury to the user. A critical component is any component in a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system or to affect its safety or effectiveness.
